Day 04 - Task Sheet

Building a Complete "Student Toolkit" Website

Requirements:

1. The application must be implemented using **HTML, CSS, and JavaScript**.
2. The page must include the following sections:
    - A **Navigation Bar** containing the following menu items:
        - GPA Calculator
        - Study Timer
    - A **Sidebar** displaying a section titled **"Upcoming Events."**

3. Use **CSS classes** to organize the layout. The design should clearly include:
    - navbar
    - sidebar

Part 2 – Logic Integration (Functional Features)

Extend the dashboard by adding **interactive tools using JavaScript**.

1. GPA Calculator

- Create a section for a **GPA Calculator**.
- The user should be able to:
    - Type the **course credits**
    - Type **grades**
- When the **"Calculate"** button is clicked:
    - The system should compute and display the **overall GPA**.

2. Pomodoro Study Timer

- Create a **Pomodoro Timer** inside the dashboard.
- Requirements:
    - A **25-minute countdown timer**
    - A **Start** button
    - A **Reset** button
    - When the timer reaches zero, a **bell sound or notification** should appear.

3. Dark Mode

- Add a **Dark Mode toggle switch** to the navigation bar.
- When enabled:
    - The interface should change from **light mode (white)** to **dark mode (dark grey/black)**.

- The toggle should switch back to light mode when clicked again.

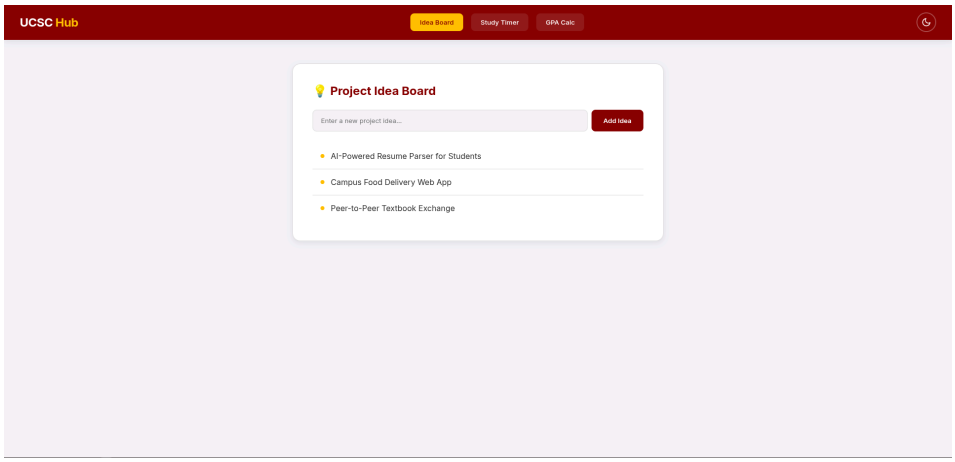
Part 3 – Aesthetic Polishing & Interaction

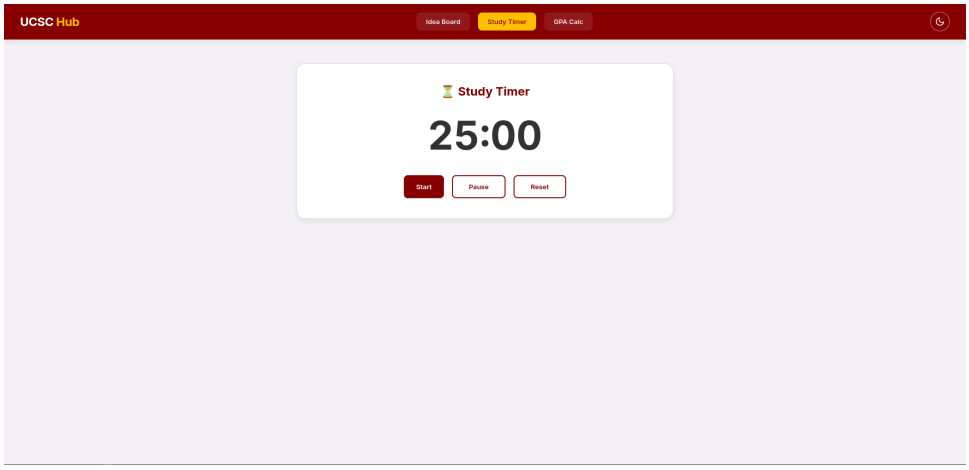
Enhance the visual appearance and interaction of the dashboard.

Requirements:

1. **Animations**
    - Add **smooth fade-in animations** so that sections appear gradually when the page loads.
2. **Interactive Sidebar**
    - When the user **hovers over items in the "Upcoming Events" sidebar**:
        - The item should **glow**.
        - The item should **expand slightly**.
3. **University Branding**
    - Change the overall color theme to match **UCSC branding colors**:
        - **Maroon**
        - **Gold**
    - Include a **placeholder image for the UCSC logo** in the navigation bar.

Sample User Interfaces





Not every page is listed here so you have to come up with your own design.

Part 1 - The Team Roles

Divide your group into **3 Subgroups** (about 3-4 people per subgroup).

You will change roles every 30 minutes or so. Inside your subgroup, use these roles:

- **The Typist:** The person who uses the laptop to code. You copy the code and run the Git commands.
- **The Prompter:** You tell the AI what to build.
- **The Tester:** You test the website. Your job is to click everything and try to break the code.

Part 2 - Setup

Before anyone writes code, we need to set up GitHub.

1. **The Typist (subgroup 1):** Open the project folder you used yesterday.
2. Pull the latest updates from GitHub: **git pull origin main**
3. Create a new branch for today's update:
    a. git checkout -b student-toolkit-website

Part 3 - subgroup 1's Turn: The Website Navigation

Your job is to build the "structure" of the website with a working menu.

- **The Prompter:** creates the prompt and generate the code using AI tools
- **The Typist:** pastes the code, saves it as index.html, and opens it in the browser.
- **The Tester:** clicks the menu buttons. Does the page change correctly? Does it look like a real website?
- **Save your work:** User the git commands from the previous sessions as needed.

Part 4 - subgroup 2's Turn: The Study Timer

Your job is to build a tool inside the website.

- **The Prompter:** asks the AI.
- **The Typist:** copies the AI's code and updates the file.
- **The Tester:** tests the timer.
    - **Test:** Click the "Start" button 10 times very fast.
    - **Question for the group:** Does the timer speed up and break? (If it does, the Prompter must ask the AI to fix it!).
- **Save your work**

And continue…

And this goes on until all the pages are completed and you are satisfied with the outcome. Don't stop there, go to Google and look for new designs and functionalities, add them as you like to complete this project, don't restrict yourself to just 3 web pages, do more and explore, be creative.

- For example, add analytics to track how many minutes have you worked on something, add charts to visualize the progress, add some dummy data to test the layout.

Part 5 - Group Activity: Link Yesterday's Work

Save the previous work and gather the whole group around the laptop. Then,

- **The Prompter (Anyone):** ask the AI

- **The Typist:** carefully copy yesterday's code into today's new website. Test it to make sure the Idea Board still works.
- **Save and Merge:** merge the changes and save the final website to the cloud.
    - git add .
    - git commit -m "Linked the Idea Board to the new website"
    - git checkout main
    - git merge student-toolkit-website
    - git push origin main

Part 6 - Document

Each group must submit a short document containing:

1. **Role Log:** List who was in subgroup 1, subgroup 2, and subgroup 3.
2. **Prompts Used:** Write down the prompts you used to generate the website and the tools.
3. **Screenshot:** Take a screenshot of your final, working Student Toolkit website.
4. **Summary:** Include a single paragraph summary describing your design process.
5. **GitHub Link:** The link to your GitHub repository.
6. Describe your experience with AI tools so far. Share your thoughts, observations, and overall opinion based on the experience you have gained while using these tools.
